Table SII. *Associations between illness perception components, quality of life (QoL) (disease-specific) and health determined by multiple linear regression analyses, after controlling for demographic variables*

	QoL		Health	
	r	Std. β (*p*)	*r*	Std. β (*p*)
Demographic				
Age (years)				
Sex (1=men; 2=women)				
Education (1–5; higher score=higher level of education)	–0.16 (0.013)		–0.16 (0.013)	–0.14 (0.023)
Illness perception				
Timeline				
Consequences	0.50 (0.000)	0.41 (0.000)	0.36 (0.000)	0.22 (0.002)
Illness coherence			–0.14 (0.033)	
Emotional representation	0.39 (0.000)	0.23 (0.002)	0.36 (0.000)	0.24 (0.002)
Adjusted R squared (%)		28		17

Pearson's *r*, standardized β values and exact *p*-values for statistically significant associations are shown.
