

Fig. S2. Immunoblotting detected IgG, but not IgA, antibodies reactive with the recombinant protein (RP) of BP180 NC16a domain (a), while no reactivity was found to the RP of BP180 C-terminal domain (b). Immunoblotting using concentrated culture supernatant of HaCaT cells detected IgG, but not IgA, antibodies to the 120 kDa LAD-1 (c). The bands depicted by * indicate a nonspecific reaction. MMP: mucous membrane pemphigoid; BP: bullous pemphigoid; LABD: linear IgA bullous dermatosis.
