

Fig. S1. Mean itch intensity of patients with itch at wound level across body location. Itch intensity at 3 months and 12 months post burn across body areas. At 3 months post burn, on average, grafted wounds produced higher itch intensities than non-grafted wounds. At 12 months post burn, on average, grafted areas did not produce higher itch intensity. Light grey boxes non-grafted, dark grey boxes grafted. Abd: Abdomen, Butt: Buttocks. Number of patients shown below.
