

Fig. S1. Hyphae and spores were observed in the stratum corneum. (a) Haematoxylin and eosin (H&E) $\times 100$. (b) Periodic acid-Schiff staining (PAS) $\times 400$. (c) White powdery cinnamon-coloured colonies with a yellow-brownish reverse were observed under macroscopic view. (d) Microscopic examination showed typical macroconidia of *M. gypseum* (cotton-blue lactophenol $\times 400$).
