

*Fig. S1.* (a) Remaining 2 lesions on the left buttock. (b) There was no change in the dermoscopy appearance, and only the upper lesion was pale blue. (c, d) Proliferation of spindle cells in a storiform pattern and scattered pigment cells were seen in the lower dermis to adipose tissue. (haematoxylin and eosin  $\times 20$  and  $\times 200$ ). (e) Immunohistochemical staining patterns for CD34, which was expressed in spindle cells ( $\times 100$ ).
