Supplementary material to article by A. Toksoy et al. “Facial Swelling and Hydroa Vacciniforme-like Skin Lesions in Epstein-Barr Virus-associated T-cell Lymphoproliferation with Subsequent Development of Lymphoma”

**Fig. S1.** (a) Immunohistochemistry of a skin biopsy from the left eye angle, showing a diffuse dermal CD4+ lymphocytic infiltrate with >60% CD4+ T cells. Magnification ×100. (b) In situ hybridization of Epstein-Barr virus RNA (EBER) in the skin. (c, d) Double immunofluorescence staining of EBER (green) and CD4 (red) and (d) CD79a (red). (e) In situ hybridization of EBV+ NK/T-cell lymphoma of the liver with (f) highly increased proliferative activity; assessed by Ki67 staining.
