

Fig. S1. Clinical and histopathological findings of case 2. (a, b) Easily bleeding reddish nodules on (a) the right lateral canthus and (b) the left inguinal area. (c) A reddish papule on the right hand. (d) Histological analysis of the right canthus (a) showing nodular proliferation of vascular endothelial cells with marginal fibrosis. The lesions macroscopically and microscopically resemble pyogenic granuloma, except for the enlarged capillary vessels in the upper dermis beneath the lesion (*arrows*). (e) Lesional skin sampled from the right hand (c) reveals the proliferation of vascular endothelial cells surrounded by fibrotic tissues and enlarged capillary vessels (*arrow*). Scale bars: (d) 500 µm and (e) 100 µm.
