Supplementary material to article by E. Gardette et al. “Livedoid Vasculopathy: A French Observational Study Including Therapeutic Options”

Fig. S2. Treatment algorithm for the management of the first livedoid vasculopathy flare at the time of diagnosis.

First flare: LMWH: tinzaparin as first-line treatment

Systematically recommend smoking cessation and compression stockings

One-month assessment:
- Pain relief: continuation of treatment
- No pain relief: switch for another anticoagulant (VKA, fondaparinux, rivaroxaban)

Three-month assessment

Complete healing:
Cessation of treatment. Maintenance therapy with antiplatelet drugs can be discussed, especially if:
- History of frequent flares before diagnosis
- Neuropathy
- Prothrombotic state
- Past experience with altered quality of life

Incomplete or no healing:
IVIG + maintenance therapy with anticoagulants (VKA ou rivaroxaban)
