**Fig. S1. Relative quantities of Chlamydiales DNA in skin swabs and skin biopsies.** In samples from each 13 patients, the relative quantities (calculated as ΔCt values $C_{Δ\text{betaglobin}} - C_{Δ\text{betaglobin}}$) of Chlamydiales DNA was larger in swabs (mean ± standard deviation (SD) 4.66 ± 12.21) than in biopsies (9.41 ± 4.58) (2-sample t-test $p < 0.0001$).
