

Fig. S1. Langerhans cell histiocytosis. (A) Generalized uniform erythematous macules and diffuse scaling affecting the whole body. (B, C) Representative images of histopathological staining of biopsy specimens show intercellular edema, capillary dilation in the upper dermis, and inflammatory infiltrate consisting of lymphocytes and eosinophils (B, hematoxylin and eosin [H&E], original magnification $\times 100$; C, $\times 400$). (D) Lymph node affected by Langerhans cell histiocytosis (H&E $\times 100$).
