

Fig. S4. Quantitative real-time PCR comparisons of selected pruritogenic mediators in lesional and perilesional skin from non-atopic prurigo nodularis (PN) patients are shown. (a-c) Nerve growth factor (NGF) axis, (d-f) interleukin (IL)-31 axis, (g-i) thymic stromal lymphopoietin (TSLP) axis, and (j-n) endothelin (ET) axis. Values show log2 expression/ACTB and are presented as the means \pm SEMs. Stars above error bars denote comparisons of matched lesional and perilesional skin. * $p < 0.05$, ** $p < 0.01$, and *** $p < 0.001$ vs perilesional skin determined by paired Student's *t*-test. NL: perilesional skin; LS: lesional skin.
