

Fig. S1. Cell viability by keishi-bukuryo-gan (KBG) and 5 medicinal plants constituent. The peripheral mononuclear cells (1×10^6) from: (A) healthy controls, and (B) patient 1 with KBG-induced skin eruption, were incubated with various concentrations of the supernatant from KBG or constituent medicinal plants for 24 h, and cell viability was assessed. Data are presented as means \pm standard deviations (SD) ($n=5$).
