

Fig. S2. Pruritus intensity on numeric rating scale (NRS; ranging from 0–10). Data of 119 of 121 patients (“total”) describing their current pruritus intensity on NRS (2 missing patients with CP). There was no statistically significant difference between AP (“acute” pruritus) and CP (“chronic” pruritus) (Mann-Whitney U test, $p=0.072$) and between major diagnosis groups (Kruskal-Wallis test, overall $p=0.565$; *post hoc* comparison with Dunn’s procedure: atopic dermatitis vs. eczema $p=1.0$; eczema vs. psoriasis $p=0.917$; psoriasis vs. atopic dermatitis $p=1.0$). n.s.: not stated.
