

**Fig. S1.** (a) Scanning view of dense lymphocytic infiltrates mainly in the peribulbar and interfollicular area of the lower dermis and the subcutaneous fat layer (red box). Mild perivascular and periappendageal lymphocytic infiltration also noted in the upper and mid dermis (haematoxylin-eosin stain,  $\times 12.5$ ). (b) Higher magnification view showing lobular panniculitis with prominent infiltrations of lymphocytes, a few plasma cells, and hyaline fat necrosis (red box) (haematoxylin-eosin stain,  $\times 100$ ). (c) Abundant mucin deposition in the deep dermis and the subcutaneous fat layers (red arrows) (Alcian blue stain,  $\times 100$ ).
