

Fig. S2. Immunohistochemistry of ichthyosis with confetti and normal epidermis. The epidermis from case 2 (b, d, f) and normal skin from healthy donors (a, c, e) were stained with anti-K10 (full length) (a, b), anti-K10 (N-term) (c, d) and anti-K1 (e, f) antibodies. Aberrant nuclear localization of keratins 1/10 was observed as brown dots in the nuclei of many epidermal keratinocytes in the patient's skin. Scale bars: 20 µm.
