

Fig. S1. (A) Biopsy sample shows dilated blood vessels in the upper dermis with mild perivascular mononuclear infiltrate. There is no blood vessel proliferation. Haematoxylin-eosin stain (H&E) (original magnification $\times 10$). (B) Prominent plump endothelial cells are evident. H&E stain (original magnification $\times 40$). (C) Some red blood extravasation can be seen, as well as intravascular neutrophils. H&E (original magnification $\times 20$). (D) Dilated blood vessels with intravascular neutrophils. H&E stain (original magnification $\times 40$).
