

Fig. S1. Galectin-9 weakly correlates with age of healthy controls. (a) Gal-9 levels weakly associated with age of healthy controls, but do not correlate with the age of patients with bullous pemphigoid (BP) at time of diagnosis (b). *Line* represents regression line, *grey shading* illustrates 95% confidence interval (95% CI), Spearman's correlation test; healthy controls: $n = 40$, patients with BP: $n = 40$.
