

Fig. S1. Clinical features of autosomal recessive congenital ichthyoses (ARCI). (A, B) A male infant affected by congenital ichthyosiform erythroderma presents whitish scales over the entire skin, generalized erythema, and ear deformity. Diffuse, large, thick, and brownish scales on the trunk and upper limbs of an adolescent affected by (C) lamellar ichthyosis and (D) similar lesions of the lower limbs of a young adult with the same ARCI subtype.
